## SUBSTITUTED 3-CYANO QUINOLINES

### BACKGROUND OF THE INVENTION

5           This invention relates to certain substituted 3-cyano quinoline compounds as well as the pharmaceutically acceptable salts thereof. The compounds of the present invention inhibit the action of certain growth factor receptor protein tyrosine kinases (PTK) thereby inhibiting the abnormal growth of certain cell types. The compounds of this invention are therefore useful for the treatment of certain diseases that are the result  
10 of deregulation of these PTKs. The compounds of this invention are anti-cancer agents and are useful for the treatment of cancer in mammals. In addition, the compounds of this invention are useful for the treatment of polycystic kidney disease in mammals. This invention also relates to the manufacture of said 3-cyano quinolines, their use for the treatment of cancer and polycystic kidney disease, and the pharmaceutical  
15 preparations containing them.

          Protein tyrosine kinases are a class of enzymes that catalyze the transfer of a phosphate group from ATP to a tyrosine residue located on a protein substrate. Protein tyrosine kinases clearly play a role in normal cell growth. Many of the growth factor receptor proteins function as tyrosine kinases and it is by this process that they effect  
20 signaling. The interaction of growth factors with these receptors is a necessary event in normal regulation of cell growth. However, under certain conditions, as a result of either mutation or overexpression, these receptors can become deregulated; the result of which is uncontrolled cell proliferation which can lead to tumor growth and ultimately to the disease known as cancer [Wilks A.F., *Adv. Cancer Res.*, 60, 43 (1993) and  
25 Parsons, J.T.; Parsons, S.J., *Important Advances in Oncology*, DeVita V.T. Ed., J.B. Lippincott Co., Phila., 3 (1993) ]. Among the growth factor receptor kinases and their proto-oncogenes that have been identified and which are targets of the compounds of this invention are the epidermal growth factor receptor kinase (EGF-R kinase, the protein product of the erbB oncogene), and the product produced by the erbB-2 (also  
30 referred to as the neu or HER2) oncogene. Since the phosphorylation event is a necessary signal for cell division to occur and since overexpressed or mutated kinases have been associated with cancer, an inhibitor of this event, a protein tyrosine kinase inhibitor, will have therapeutic value for the treatment of cancer and other diseases characterized by uncontrolled or abnormal cell growth. For example, overexpression of  
35 the receptor kinase product of the erbB-2 oncogene has been associated with human breast and ovarian cancers [Slamon, D. J., et. al., *Science*, 244, 707 (1989) and

- 2 -

5 *Science*, 235 , 1146 (1987)]. Deregulation of EGF-R kinase has been associated with epidermoid tumors [Reiss, M., et. al., *Cancer Res.*, 51, 6254 (1991)], breast tumors [Macias, A., et. al., *Anticancer Res.*, 7, 459 (1987)], and tumors involving other major organs [Gullick, W.J., *Brit. Med. Bull.*, 47, 87 (1991)]. Because of the importance of the role played by deregulated receptor kinases in the pathogenesis of cancer, many recent studies have dealt with the development of specific PTK inhibitors as potential anti-cancer therapeutic agents [some recent reviews: Burke. T.R., *Drugs Future*, 17, 119 (1992) and Chang, C.J.; Geahlen, R.L., *J. Nat. Prod.*, 55, 1529 (1992)].

10 It is also known that deregulation of EGF receptors is a factor in the growth of epithelial cysts in the disease described as polycystic kidney disease [Du J., Wilson P. D., *Amer. J. Physiol.*, 269(2 Pt 1), 487 (1995); Nauta J., et al., *Pediatric Research* , 37(6), 755 (1995); Gattone V.H., et al., *Developmental. Biology*, 169(2), 504 (1995); Wilson P.D., et al., *Eur. J. Cell Biol.*, 61(1), 131, (1993)]. The compounds of this invention, which inhibit the catalytic function of the EGF receptors, are consequently  
15 useful for the treatment of this disease.

The mitogen-activated protein kinase (MAPK) pathway is a major pathway in the cellular signal transduction cascade from growth factors to the cell nucleus. The  
20 pathway involves kinases at two levels: MAP kinase kinases (MAPKK), and their substrates MAP kinases (MAPK). There are different isoforms in the MAP kinase family. (For review, see Rony Seger and Edwin G. Krebs, *FASEB*, Vol. 9, 726, June 1995). The compounds of this invention can inhibit the action of two of these kinases: MEK, a MAP kinase kinase, and its substrate ERK, a MAP kinase. MEK is  
25 activated by phosphorylation on two serine residues by upstream kinases such as members of the *raf* family. When activated, MEK catalyzes phosphorylation on a threonine and a tyrosine residue of ERK. The activated ERK then phosphorylates and activates transcription factors in the nucleus, such as *fos* and *jun*, or other cellular targets with PXT/SP sequences. ERK, a p42 MAPK is found to be essential for cell  
30 proliferation and differentiation. Over-expression and/or over-activation of Mek or ERK has been found to be associated with various human cancers (For example, Vimala S. Sivaraman, Hsien-yu Wang, Gerard J. Nuovo, and Craig C. Malbon, *J. Clin. Invest.* Vol. 99, No. 7 April 1997). It has been demonstrated that inhibition of MEK prevents activation of ERK and subsequent activation of ERK substrates in cells,  
35 resulting in inhibition of cell growth stimulation and reversal of the phenotype of *ras*-transformed cells (David T. Dudley, Long Pang, Stuart J. Decker, Alexander J.

- 3 -

Bridges, and Alan R. Saltiel, PNAS, Vol. 92, 7686, August 1995). Since, as demonstrated below, the compounds of this invention can inhibit the coupled action of MEK and ERK, they are useful for the treatment of diseases such as cancer which are characterized by uncontrolled cell proliferation and which, at least in part, depend on the MAPK pathway.

Epithelial Cell Kinase (ECK) is a receptor protein tyrosine kinase (RPTK) belonging to the EPH (Erythropoietin Producing Hepatoma) family. Although originally identified as an epithelial lineage-specific tyrosine kinase, ECK has subsequently been shown to be expressed on vascular endothelial cells, smooth muscle cells, and fibroblasts. ECK is a type I transmembrane glycoprotein with the extracellular ligand-binding domain consisting of a cysteine-rich region followed by three fibronectin type III repeats. The intracellular domain of ECK possesses a tyrosine kinase catalytic domain that initiates a signal transduction cascade reflecting the ECK function. ECK binds and is subsequently activated by its counter-receptor, Ligand for Eph-Related Kinase (LERK)-1, which is an immediate early response gene product readily inducible in a lineage-unrestricted manner with proinflammatory cytokines such as IL-1 or TNF. Soluble LERK-1 has been shown to stimulate angiogenesis in part by stimulating ECK in a murine model of corneal angiogenesis. Unlike their normal counterparts, tumor cells of various lineages constitutively express LERK-1 and this expression can further be upregulated by hypoxia and proinflammatory cytokines. Many of these tumor cells also express ECK at higher levels than their normal counterparts, thereby creating an opportunity for autocrine stimulation via ECK : LERK-1 interaction. The increased expression of both ECK and LERK-1 has been correlated with the transformation of melanomas from the noninvasive horizontal phase of growth into very invasive vertically growing metastatic melanomas. Together, the ECK : LERK-1 interaction is believed to promote tumor growth via its tumor growth promoting and angiogenic effects. Thus, the inhibition of the ECK tyrosine kinase activity mediating signaling cascade induced by its binding and cross-linking to LERK-1 may be therapeutically beneficial in cancer, inflammatory diseases, and hyperproliferative disorders. As is shown below, the compounds of this invention inhibit the tyrosine kinase activity of ECK and are therefore useful for the treatment of the aforementioned disorders.

Growth of most solid tumors is dependent on the angiogenesis involving activation, proliferation and migration of vascular endothelial cells and their subsequent differentiation into capillary tubes. Angiogenization of tumors allows them access to blood-derived oxygen and nutrients, and also provides them adequate perfusion.

- 4 -

Hence inhibiting angiogenesis is an important therapeutic strategy in not only cancer but also in a number of chronic diseases such as rheumatoid arthritis, psoriasis, diabetic retinopathy, age-related macular degeneration, and so on. Tumor cells produce a number of angiogenic molecules. Vascular Endothelial Growth Factor (VEGF) is one such angiogenic factor. VEGF, a homodimeric disulfide-linked member of the PDGF family, is an endothelial cell-specific mitogen and is known to cause profound increase in the vascular endothelial permeability in the affected tissues. VEGF is also a senescence-preventing survival factor for endothelial cells. Almost all nucleated tissues in the body possess the capability to express VEGF in response to various stimuli including hypoxia, glucose deprivation, advanced glycation products, inflammatory cytokines, etc. Growth-promoting angiogenic effects of VEGF are mediated predominantly via its signaling receptor Kinase insert Domain containing Receptor (KDR). The expression of KDR is low on most endothelial cells; however, activation with angiogenic agents results in a significant upregulation of KDR on endothelial cells. Most angiogenized blood vessels express high levels of KDR. KDR is a receptor protein tyrosine kinase with an extracellular VEGF-binding domain consisting of 7 immunoglobulin-like domains and a cytoplasmic domain containing the catalytic tyrosine kinase domain split by a kinase-insert region. Binding to VEGF causes dimerization of KDR resulting in its autophosphorylation and initiation of signaling cascade. Tyrosine kinase activity of KDR is essential for mediation of its functional effects as a receptor for VEGF. Inhibition of KDR-mediated functional effects by inhibiting KDR's catalytic activity is considered to be an important therapeutic strategy in the treatment of angiogenized disease states including cancer. As is shown below, the compounds of this invention inhibit the tyrosine kinase activity of KDR and are therefore useful for the treatment of the aforementioned disease states.

In addition to the above utilities some of the compounds of this invention are useful for the preparation of other compounds of this invention.

The compounds of this invention are certain substituted 3-cyano quinolines. Throughout this patent application, the quinoline ring system will be numbered as indicated in the formula below; the numbering for the quinazoline ring system is also shown :

- 5 -

No 3-cyano quinolines have been reported that have biological activity as inhibitors of protein tyrosine kinases. A 3-cyano quinoline with a 4-(2-methyl anilino) substituent having gastric ( $H^+/K^+$ )-ATPase inhibitory activity at high concentrations has been described [Ife R.J., et al., *J. Med. Chem.*, 35(18), 3413 (1992)].

5        There are quinolines that do not have the 3-cyano substituent and, unlike the compounds of this invention, are unsubstituted at the 4-position but are reported to be inhibitors of protein tyrosine kinases [Gazit A., et al., *J. Med. Chem.*, 39(11), 2170 (1996)]. A series of quinolines that have a 3-pyridyl substituent and no substituent at the 4-position have been described as inhibitors of platelet derived growth factor  
10 receptor kinase [Dolle R.E., et al., *J. Med. Chem.*, 372, 2627 (1994) and Maguire M.P., et al., *J. Med. Chem.*, 372, 129 (1994)]. The patent application WO 96/09294 describes inhibitors of protein tyrosine kinases that include 4-anilino quinolines with a large variety of substituents on positions 5-8 but which must also have a hydrogen atom at position 3. The US patent 5,480,883 describes quinoline derivatives that are  
15 inhibitors of protein tyrosine kinases but these derivatives do not have the unique combination of substituents, including the 3-cyano group, contained in the compounds of the present invention.

In addition to quinolines, certain quinazoline derivatives that are similar, in some respects, to the compounds of this invention are known to be inhibitors of protein  
20 tyrosine kinases. The application EP-92305703.8 describes 4-anilinoquinazolines that contain simple substituents such as chloro, trifluoromethyl, or nitro groups at positions 5 to 8. The application EP-93300270.1 is similar but with a much larger variety of substituents now allowed at positions 5 to 8. The application WO-9609294 describes compounds with similar substituents at positions 5 to 8 and with the substituent at to  
25 4-position consisting of some polycyclic ring systems. Some simple substituted quinazolines are also described in the applications WO-9524190, WO-9521613, and WO-9515758. The applications EP-93309680.2 and WO-9523141 cover similar quinazoline derivatives where the aryl group attached at position 4 can be a variety of heterocyclic ring structures. The application EP-94305195.3 describes certain  
30 quinazoline derivatives that have alkenoylamino and alkynoylamino groups among the substituents at position 6 and a halogen atom at position 7. The application WO-9519774 describes compounds where one or more of the carbon atoms at positions 5-8 can be replaced with heteroatoms resulting in a large variety of bicyclic systems where the left-hand ring is a 5 and 6-membered heterocyclic ring; in addition, a  
35 variety of substituents are allowed on the left-hand ring. The application EP-682027-A1 describes certain pyrrolopyrimidine inhibitors of PTKs. The application WO-

- 6 -

9519970 describes compounds in which the left-hand aromatic ring of the basic quinazoline structure has been replaced with a wide variety of different heterocyclic rings so that the resulting inhibitors are tricyclic. The application WO-94305194.6 describes quinazolines where an additional 5 or 6-membered heterocyclic ring with optional substitution is fused at positions 5 and 6.

In addition to the aforementioned patent applications, a number of publications describe 4-anilinoquinazolines: Fry, D.W., et. al., *Science*, 265, 1093 (1994), Rewcastle G.W., et. al., *J. Med. Chem.*, 38, 3482 (1995), and Bridges, A.J., et. al., *J. Med. Chem.*, 39, 267, (1996). There are no publications that describe 3-cyano quinolines as PTK inhibitors.

The preparation of the compounds of this invention encompassed by Formula 18 is described below in Flowsheet C where X, Y, n,  $\text{R}_1'$ ,  $\text{R}_2'$ ,  $\text{R}_3'$ , and  $\text{R}_4'$  are as described above. The substituted aniline of Formula 12 is heated with or without a solvent with the reagent 13 to give intermediate 14 as a mixture of isomers.

10 Thermolysis of 14 in a high boiling solvent such as diphenyl ether at 200-350°C gives the 3-cyano quinolones of Formula 15; these intermediates may also exist in the 4-hydroxy quinoline tautomeric form. In those cases where  $\text{R}_4'$  is a hydrogen atom, the intermediates 15 may be formed as a mixture of two regioisomers. These isomers can

be separated by methods well known in the art including, but not limited to, fractional

15 crystallization and chromatographic methods. The separated isomers can then be converted separately to the compounds of the invention. Alternatively, the isomers can

be separated at a later stage of the synthesis. Heating compounds 15 with or without solvent with a chlorinating agent such as phosphorous oxychloride or phosphorous pentachloride gives the 4-chloro-3-cyano quinolines of Formula 16. Condensation of

20 16 with a nucleophilic amine, aniline, mercaptan, thiophenol, phenol, or alcohol reagent of Formula 17 gives the 3-cyano quinolines of this invention of Formula 18;

this condensation can be accelerated by heating the reaction mixture or by using basic catalysts such as trialkylamines, sodium hydride in an inert solvent, sodium or

- 17 -

In those cases where the substituents X, R<sub>1</sub>', R<sub>2</sub>', R<sub>3</sub>', and R<sub>4</sub>' may contribute an asymmetric carbon atom, the intermediates can be used as the racemate or as the individual R or S enantiomers in which case the compounds of this invention will be in the racemic or R and S optically active forms, respectively. Based on the activity shown in the standard pharmacological test procedures, the compounds of this invention are therefore useful as antineoplastic agents. The test procedures used and results obtained are shown below.

### 30 Inhibition of Epidermal Growth Factor Receptor Kinase (EGF-R, membrane extract)

Representative compounds of the invention were evaluated for their ability to inhibit the phosphorylation of the tyrosine residue of a peptide substrate catalyzed by the enzyme epidermal growth factor receptor kinase in the standard pharmacological test procedure described below. The peptide substrate (RR-SRC) has the sequence

- 22 -

arg-arg-leu-ile-glu-asp-ala-glu-tyr-ala-ala-arg-gly. The enzyme was obtained as a membrane extract of A431 cells (American Type Culture Collection, Rockville, MD). A431 cells were grown in T175 flasks to 80% confluency. The cells were washed twice with phosphate buffered saline (PBS) without  $\text{Ca}^{2+}$ . Flasks were rotated for 1.5  
5 hours in 20 ml PBS with 1.0 mM ethylenediaminetetraacetic acid (EDTA) at room temperature and centrifuged at 600g for 10 minutes. The cells were solubilized in 1 ml per  $5 \times 10^6$  cells of cold lysis buffer {10mM 4-(2-hydroxyethyl)-1-piperazineethane-sulfonic acid (HEPES), pH 7.6, 10 mM NaCl, 2mM EDTA, 1mM phenylmethyl-sulfonyl-fluoride (PMSF), 10 mg/ml aprotinin, 10 mg/ml leupeptin, 0.1 mM sodium  
10 orthovanadate} in a Dounce homogenizer with 10 strokes on ice. The lysate was centrifuged at 600g for 10 minutes first to clear cell debris and the supernatant further centrifuged at 100,000 g for 30 min at 4°C. The membrane pellet was suspended in 1.5 ml HNG buffer (50 mM HEPES, pH 7.6, 125 mM NaCl, 10% glycerol). The membrane extract was divided into aliquots, immediately frozen in liquid nitrogen and  
15 stored at -70°C.

Compounds to be evaluated were made into 10 mg/ml stock solutions in 100% dimethylsulfoxide (DMSO). Prior to experiment, stock solutions were diluted to 500 mM with buffer (30 mM Hepes pH 7.4) and then serially diluted to the desired concentration.

20 An aliquot of the A431 membrane extract (10 mg/ml) was diluted in 30 mM HEPES (pH 7.4) to give a protein concentration of 50 ug/ml. To 4  $\mu\text{l}$  of enzyme preparation, EGF (1 $\mu\text{l}$  at 12  $\mu\text{g/ml}$ ) was added and incubated for 10 min on ice followed by 4  $\mu\text{l}$  of the test compound or buffer; this mix was incubated on ice for 30 min. To this was added the  $^{33}\text{P}$ -ATP (10 mCi/ml) diluted 1:10 in assay buffer along  
25 with the substrate peptide at a concentration of 0.5 mM (control reactions get no test compound) and the reaction was allowed to proceed for 30 min at 30°C. The reaction was stopped with 10% TCA and left on ice for at least 10 min after which tubes were microcentrifuged at full speed for 15 min. The a portion of the supernatants were spotted on P81 phosphocellulose discs and washed twice in 1% acetic acid then water  
30 for 5 min each followed by scintillation counting. The inhibition data for representative compounds of the invention are shown below in TABLE 1. The  $\text{IC}_{50}$  is the concentration of test compound needed to reduce the total amount of phosphorylated substrate by 50%. The % inhibition of the test compound was determined for at least three different concentrations and the  $\text{IC}_{50}$  value was evaluated from the dose response  
35 curve. The % inhibition was evaluated with the following formula:

$$\% \text{ inhibition} = 100 - [\text{CPM}(\text{drug})/\text{CPM}(\text{control})] \times 100$$

- 23 -

where CPM(drug) is in units of counts per minute and is a number expressing the amount of radiolabeled ATP (g-<sup>33</sup>P) incorporated onto the RR-SRC peptide substrate by the enzyme after 30 minutes at 30°C in the presence of test compound as measured by liquid scintillation counting. CPM(control) is in units of counts per minute and was a number expressing the amount of radiolabeled ATP (g-<sup>33</sup>P) incorporated into the RR-SRC peptide substrate by the enzyme after 30 minutes at 30°C in the absence of test compound as measured by liquid scintillation counting. The CPM values were corrected for the background counts produced by ATP in the absence of the enzymatic reaction. The IC<sub>50</sub> values reported in TABLE 1 are averages of the number of tests conducted.

As shown by the data presented in TABLE 1, the compounds of this invention are effective inhibitors of the epidermal growth factor receptor kinase and are, as such, useful for the treatment of diseases such as cancer and polycystic kidney disease where deregulation of the kinase is a component of the disease.

Inhibition of Epidermal Growth Factor Receptor Kinase (EGF-R )  
using recombinant enzyme

Representative compounds of the invention were evaluated for their ability to inhibit the phosphorylation of the tyrosine residue of a peptide substrate catalyzed by the enzyme epidermal growth factor receptor kinase. The peptide substrate (RR-SRC) has the sequence arg-arg-leu-ile-glu-asp-ala-glu-tyr-ala-ala-arg-gly. The enzyme used in this assay is the His-tagged cytoplasmic domain of EGFR. A recombinant baculovirus (vHcEGFR52) was constructed containing the EGFR cDNA encoding amino acids 645 - 1186 preceded by Met-Ala-(His)<sub>6</sub>. Sf9 cells in 100 mm plates were infected at an moi of 10 pfu/cell and cells were harvested 48 h post infection. A cytoplasmic extract was prepared using 1% Triton X-100 and applied to Ni-NTA column. After washing the column with 20 mM imidazole, HcEGFR was eluted with 250 mM imidazole (in 50 mM Na<sub>2</sub>HPO<sub>4</sub>, pH 8.0, 300 mM NaCl). Fractions collected were dialyzed against 10 mM HEPES, pH 7.0, 50 mM NaCl, 10% glycerol, 1µg/mL antipain and leupeptin and 0.1 mM Pefabloc SC. The protein was frozen in dry ice/methanol and stored -70°C.

Compounds to be evaluated were made into 10 mg/mL stock solutions in 100% dimethylsulfoxide (DMSO). Prior to experiment, stock solutions were diluted to 500 µM with 100% DMSO and then serially diluted to the desired concentration with HEPES buffer (30 mM HEPES pH 7.4).

For the enzyme reaction, 10 µL of each inhibitor (at various concentrations) were added to each well of a 96-well plate. To this was added 3 µL of enzyme (1:10 dilution in 10mM HEPES, pH 7.4 for final conc. of 1:120). This was allowed to sit for 10 min on ice and was followed by the addition of 5 µl peptide (80 µM final conc.), 10µl of 4X Buffer (Table A), 0.25 µL <sup>33</sup>P-ATP and 12 µL H<sub>2</sub>O. The reaction was allowed to run for 90 min at room temperature and was followed by spotting the entire volume on to precut P81 filter papers. The filter discs were washed 2X with 0.5% phosphoric acid and radioactivity was measured using a liquid scintillation counter.

The inhibition data for representative compounds of the invention are shown below in TABLE 2. The IC<sub>50</sub> is the concentration of test compound needed to reduce the total amount of phosphorylated substrate by 50%. The % inhibition of the test compound was determined for at least three different concentrations and the IC<sub>50</sub> value was evaluated from the dose response curve. The % inhibition was evaluated with the following formula:

$$\% \text{ inhibition} = 100 - [\text{CPM}(\text{drug})/\text{CPM}(\text{control})] \times 100$$

where CPM(drug) is in units of counts per minute and is a number expressing the amount of radiolabeled ATP (g-<sup>33</sup>P) incorporated onto the RR-SRC peptide substrate by the enzyme after 90 minutes at room temperature in the presence of test compound as measured by liquid scintillation counting. CPM(control) is in units of counts per minute and was a number expressing the amount of radiolabeled ATP (g-<sup>33</sup>P) incorporated into the RR-SRC peptide substrate by the enzyme after 90 minutes at room temperature in the absence of test compound as measured by liquid scintillation counting. The CPM values were corrected for the background counts produced by ATP in the absence of the enzymatic reaction. The IC<sub>50</sub> values reported in TABLE 2 are averages of the number of tests conducted.

Inhibition of Cancer Cell Growth as Measured by the Incorporation of [<sup>3</sup>H]-Thymidine

Representative compounds of this invention were evaluated for their ability to inhibit the growth of the cell lines described below in vitro. The inhibition is quantitated by measuring the decrease in the incorporation of radio-labeled thymidine when the cells are grown in the presence of the inhibitor. A431 and SKBR3 cell lines are obtained from American Type Culture Collection, Rockville, MD. Neu-3T3 cells are obtained by transfecting NIH 3T3 mouse fibroblasts with an activated rat Neu oncogene. NHEK cells are obtained from Clonetics (San Diego, CA). Cells were routinely grown in a humidified incubator in 5% CO<sub>2</sub> in air. These cell lines are dependent on growth factors which are ligands to the receptor tyrosine kinases that are the targets of the compounds of this invention, and have the following characteristics:

- A431: human epidermoid carcinoma cells overexpressing EGFR  
Neu-3T3: NIH 3T3 cells transfected with activated Neu oncogene  
NHEK: EGF dependent normal human epidermal keratinocytes  
SKBR3: Human breast cancer cells overexpressing ErbB2 gene

The cell lines were grown in appropriate media as described below:

- A431: Dulbecco's Modified Eagles Media, high glucose, BRL/Gibco  
(10% Fetal Bovine Serum (FBS), Glutamine, Penicillin-Streptomycin)  
Dulbecco, R., Freeman, G. *Virology* 8, 396 (1959).  
Neu-3T3: Dulbeccos Modified Eagles Media, high glucose  
(10% Fetal Bovine Serum, Glutamine, Penicillin-Streptomycin)  
SKBR3: Roswell Park Memorial Institute 1640 W/GLU (10% FBS, GLU, PS)  
Moore, G. E., Gerner, R. E. and Franklin, H. A. *A.M.A.*,  
199, 516 (1967).  
NHEK: Keratinocyte Growth Media, Clonetics  
Boyce, S.T. and Ham, R. G. *In Vitro* 17, 239 (Abstract No.  
159) (1981)

Cells were seeded at 10,000 cells/well in 96 well plates in complete media and allowed to grow to log phase. At this stage the complete media was replaced with media containing 0.5% FBS (for cells growing in 10% FBS) or media lacking epidermal growth factor (EGF) (for cells growing in serum free media). After overnight incubation in low serum (or EGF lacking) media, the compounds to be

- 29 -

evaluated were added and cells remained in the presence of compounds for 48 to 72 hours. Media with test compound was then removed and complete media was added back. The cells were allowed to grow for 18 hours. This is followed by incubation in [<sup>3</sup>H]thymidine (1mCi/ml in serum/EGF media) for 4 hours. Cells were lysed in 0.5 M NaOH for at least 30 min at 37°C and radioactivity analyzed.

The cell growth inhibition data is provided below in TABLE 3. The IC<sub>50</sub> is the concentration of test compound needed to reduce the amount of [<sup>3</sup>H]thymidine incorporation by 50%. The % inhibition of the compound evaluated was determined for at least three different concentrations and the IC<sub>50</sub> value evaluated from the dose response curve. The % inhibition is evaluated with the following formula:

$$\% \text{ inhibition} = 100 - [\text{CPM}(\text{drug})/\text{CPM}(\text{control})] \times 100$$

where CPM(drug) is in units of counts per minute and is a number expressing the amount of [<sup>3</sup>H]thymidine incorporated into the DNA when cells are grown in the presence of test compound as measured by liquid scintillation counting. CPM(control) is in units of counts per minute and is a number expressing the amount of [<sup>3</sup>H]thymidine incorporated onto the DNA when cells are grown in the absence of test compound as measured by liquid scintillation counting.

- 5 As illustrated by the data presented in TABLE 3, the compounds of this invention are effective inhibitors of cancer cell growth and are therefore useful as antineoplastic agents.

#### Inhibition of Cancer Cell Growth as Measured by Cell Number

- 10 Human tumor cell lines were plated in 96-well plates (250 ml/well,  $1-6 \times 10^4$  cells/ml) in RPMI 1640 medium, containing 5% FBS (Fetal Bovine Serum). Twenty four hours after plating, test compounds were added at five log concentrations (0.01-100 mg/ml) or at lower concentrations for the more potent compounds. After 48 hours exposure to test compounds, cells were fixed with trichloroacetic acid, and stained with
- 15 Sulforhodamine B according to the methods of Skehan et al (*J.Natl. Canc. Inst.*1990, , 82, 1107-1112. After washing with trichloroacetic acid, bound dye was solubilized in 10 mM Tris base and optical density was determined using plate reader. Under conditions of the assay the optical density is proportional to the number of cells in the well. IC<sub>50</sub>s (concentrations causing 50% inhibition of cell growth) were determined

- 31 -

from the growth inhibition plots. These data are shown below in Tables 4-8 . The cell lines were chosen since they overexpressed epidermal growth factor receptor (EGFR) (i.e. A431) or HER2/neu (SKBR3), or had little to no expression of the these receptors (SW620, LOX, MCF7). Expression levels of these receptors were determined by antibody staining methods using EGFR or HER/neu directed antibodies and was similar to previously published data (Lewis et al., Cancer Immunol. Immunother., 1993, 37: 255-262). Other information about some of the cell lines used in these test procedures is available from the American Type Tissue Collection: Cell Lines and Hybridomas, 1994 Reference Guide, 8th Edition. In the Tables below, there may be separate entries for the same compound; this is an indication that the compound was tested more than one time. In the tables below, if a compound is missing a data value for a particular cell line, this is an indication that that compound was not tested against that cell line.

#### In Vivo Inhibition of the Growth of Human Epidermoid Tumors (A431)

Representative compounds of this invention (listed below) were evaluated in an in vivo standard pharmacological test procedure which measured its ability to inhibit the growth of human epidermoid tumors. Human epidermoid carcinoma cells A-431 (American Type Culture Collection, Rockville, Maryland # CRL-155) were grown in vitro as described above. BALB/c nu/nu female mice (Charles River, Wilmington, MA) were used in this in vivo standard pharmacological test procedure. A unit of 5 X 10<sup>6</sup> cells were injected SC into mice. When tumors attained a mass of between 100 and 150 mg, the mice were randomized into treatment groups (day zero). Mice were treated IP once a day either on days 1, 5, and 9 or on days 1 through 10 post staging with doses of either 80, 40 or 20 mg/kg/dose of the compound to be evaluated in 0.2% Klucel. Control animals received no drug. Tumor mass was determined every 7 days [(length X width<sup>2</sup>)/2] for 28 days post staging. Relative tumor growth (Mean tumor mass on days 7, 14, 21, and 28 divided by the mean tumor mass on day zero) is determined for each treatment group.

When evaluated in this test procedure, the compound of Example 18 (80 mg/kg administered on days 1, 5, and 9) reduced tumor size by 29% on day 7 and by 45% (p < 0.01) on day 14. Tumor growth was not reduced versus control when mice treated with the compound of Example 18 were evaluated on days 21 and 28.

The compound of Example 47 was similarly evaluated for its ability to inhibit the growth of human epidermoid tumors in vivo using the standard pharmacological test procedure described above. The results obtained are shown in Table 9.

#### Inhibition of Epithelial Cell Kinase (ECK)

In this standard pharmacological test procedure, a biotinylated peptide substrate is first immobilized on neutravidin-coated microtiter plates. The test drug, the Epithelial Cell Kinase (ECK),  $\text{Mg}^{++}$ , sodium vanadate (a protein tyrosine phosphatase inhibitor), and an appropriate buffer to maintain pH (7.2) are then added to the immobilized substrate-containing microtiter wells. ATP is then added to initiate phosphorylation. After incubation, the assay plates are washed with a suitable buffer leaving behind phosphorylated peptide which is exposed to horse radish peroxidase (HRP)-conjugated anti-phosphotyrosine monoclonal antibody. The antibody-treated plates are washed again and the HRP activity in individual wells is quantified as a reflection of degree of substrate phosphorylation. This nonradioactive format was used to identify inhibitors of ECK tyrosine kinase activity where the  $\text{IC}_{50}$  is the concentration of drug that inhibits substrate phosphorylation by 50%.

Inhibition of Kinase insert Domain containing Receptor  
(KDR; the catalytic domain of the VEGF receptor)

- 5 In this standard pharmacological test procedure, KDR protein is mixed, in the presence or absence of a inhibitor compound, with a substrate peptide to be phosphorylated (a copolymer of glutamic acid and tyrosine, E:Y :: 4:1) and other cofactors such as  $Mg^{++}$  and sodium vanadate (a protein tyrosine phosphatase inhibitor) in an appropriate buffer to maintain pH (7.2). ATP and a radioactive tracer (either  $P^{32}$ -  
 10 or  $P^{33}$ - labeled ATP) is then add to initiate phosphorylation. After incubation, the radioactive phosphate associated with the acid-insoluble fraction of the assay mixture is then quantified as reflection of substrate phosphorylation. This radioactive format was used to identify inhibitors of KDR tyrosine kinase activity where the  $IC_{50}$  is the  
 15 concentration of drug that inhibits substrate phosphorylation by 50%.

#### Mitogen Activated Protein Kinase (MAPK) Assay

To evaluate inhibitors of the MAP (mitogen activated protein) kinase a two component coupled standard pharmacological test procedure, which measures phosphorylation of a serine/threonine residue in an appropriate sequence in the substrate in the presence and absence of a putative inhibitor, was used. Recombinant human MEK 1 (MAPKK) was first used to activate recombinant human ERK2 (MAPK) and the activated MAPK (ERK) was incubated with substrate (MBP peptide or MYC peptide) in the presence of ATP,  $Mg^{+2}$  and radiolabeled  $^{33}P$  ATP. The phosphorylated peptide was captured on a P 81 phosphocellulose filter (paper filter or embedded in microtiter plate) washed and counted by scintillation methods.

The peptide substrates used in the assay are MBP, peptide substrate (APRTPGGRR), or synthetic Myc substrate, (KKFELLTPPLSPSR)•5 TFA. The recombinant enzymes used were prepared as GST fusion proteins of human ERK 2 and human MEK 1. Inhibitor samples were prepared as 10X stocks in 10% DMSO and an appropriate aliquot was used to deliver either 10 ug/ml for a single point screening dose or 100, 10, 1, and 0.1 uM final concentration for a dose response curve. Final DMSO concentrations were less than or equal to 1%.

The reaction was run as follows in 50 mM Tris kinase buffer, pH 7.4 in a reaction volume of 50 ul. The appropriate volume of kinase buffer and inhibitor sample was added to the tube. Appropriate dilution of enzyme was delivered to give 2-5 ug recombinant MAPK (Erk ) per tube. The inhibitor was incubated with MAPK (Erk) for 30 min at 0 deg. C. Recombinant Mek (MAPKK) ( 0.5-2.5 ug) or fully activated Mek (0.05-0.1 units) was added to activate the Erk and incubated for 30 min at 30° C. Then substrate and gamma  $^{33}P$  ATP was were added to give a final concentration of 0.5- 1 mM MBPP or 250-500 uM Myc; 0.2-0.5 uCi gamma P 33 ATP/tube; 50 uM ATP final concentration. Samples were incubated at 30°C for 30 minutes and the reaction was stopped by adding 25 ul of ice cold 10 %TCA .After samples were chilled on ice for 30 min, 20 ul of sample was transferred onto P 81 phosphocellulose filter paper or appropriate MTP with embedded P 81 filter. Filter papers or MTP were washed 2 times with a large volume of 1% acetic acid, then 2 times with water. The filters or MTP were briefly air dried before addition of scintillant and samples were counted in the appropriate scintillation counter set up for reading  $^{33}P$  isotope. Samples included a positive control (activated enzyme plus substrate); a no enzyme control; a no substrate control; samples with different concentrations of putative inhibitor; and samples with

reference inhibitors (other active compounds or non-specific inhibitors such as staurosporine or K252 B).

The raw data was captured as cpm. Sample replicates were averaged and corrected for background count. Mean cpm data was tabulated by group and % inhibition by a test compound was calculated as (corrected cpm control- corrected. cpm sample/control) X 100 = % inhibition. If several concentrations of inhibitor were tested, IC<sub>50</sub> values (the concentration which gives 50% inhibition) were determined graphically from the dose response curve for % inhibition or by an appropriate computer program. In the Table below, there may be separate entries for the same compound; this is an indication that the compound was evaluated more than one time.

- 5           Based on the results obtained for representative compounds of this invention, the compounds of this invention are antineoplastic agents which are useful in treating, inhibiting the growth of, or eradicating neoplasms. In particular, the compounds of this invention are useful in treating, inhibiting the growth of, or eradicating neoplasms that express EGFR such as those of the breast, kidney, bladder, mouth, larynx, esophagus,
- 10 stomach, colon, ovary, or lung. In addition, the compounds of this invention are useful in treating, inhibiting the growth of, or eradicating neoplasms of the breast that express the receptor protein produced by the erbB2 (Her2) oncogene.

- 47 -

The compounds of this invention may be formulated neat or may be combined with one or more pharmaceutically acceptable carriers for administration. For example, solvents, diluents and the like, and may be administered orally in such forms as tablets, capsules, dispersible powders, granules, or suspensions containing, for example, from  
5 about 0.05 to 5% of suspending agent, syrups containing, for example, from about 10 to 50% of sugar, and elixirs containing, for example, from about 20 to 50% ethanol, and the like, or parenterally in the form of sterile injectable solution or suspension containing from about 0.05 to 5% suspending agent in an isotonic medium. Such pharmaceutical preparations may contain, for example, from about 0.05 up to about  
10 90% of the active ingredient in combination with the carrier, more usually between about 5% and 60% by weight. Pharmaceutical compositions comprising a compound of Formula 1 or a pharmaceutically acceptable salt thereof and a pharmaceutically acceptable carrier form a further aspect of the present invention.

The effective dosage of active ingredient employed may vary depending on the  
15 particular compound employed, the mode of administration and the severity of the condition being treated. However, in general, satisfactory results are obtained when the compounds of the invention are administered at a daily dosage of from about 0.5 to about 1000 mg/kg of animal body weight, optionally given in divided doses two to four times a day, or in sustained release form. For most large mammals the total daily  
20 dosage is from about 1 to 1000 mg, preferably from about 2 to 500 mg. Dosage forms suitable for internal use comprise from about 0.5 to 1000 mg of the active compound in intimate admixture with a solid or liquid pharmaceutically acceptable carrier. This dosage regimen may be adjusted to provide the optimal therapeutic response. For example, several divided doses may be administered daily or the dose may be  
25 proportionally reduced as indicated by the exigencies of the therapeutic situation.

The compounds of this invention may be administered orally as well as by intravenous, intramuscular, or subcutaneous routes. Solid carriers include starch, lactose, dicalcium phosphate, microcrystalline cellulose, sucrose and kaolin, while liquid carriers include sterile water, polyethylene glycols, non-ionic surfactants and  
30 edible oils such as corn, peanut and sesame oils, as are appropriate to the nature of the active ingredient and the particular form of administration desired. Adjuvants customarily employed in the preparation of pharmaceutical compositions may be advantageously included, such as flavoring agents, coloring agents, preserving agents, and antioxidants, for example, vitamin E, ascorbic acid, BHT and BHA.

- 48 -

The preferred pharmaceutical compositions from the standpoint of ease of preparation and administration are solid compositions, particularly tablets and hard-filled or liquid-filled capsules. Oral administration of the compounds is preferred.

5 In some cases it may be desirable to administer the compounds directly to the airways in the form of an aerosol.

The compounds of this invention may also be administered parenterally or intraperitoneally. Solutions or suspensions of these active compounds as a free base or pharmacologically acceptable salt can be prepared in water suitably mixed with a surfactant such as hydroxy-propylcellulose. Dispersions can also be prepared in  
10 glycerol, liquid polyethylene glycols and mixtures thereof in oils. Under ordinary conditions of storage and use, these preparation contain a preservative to prevent the growth of microorganisms.

The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of

It must be stable under the conditions of manufacture and storage and must be preserved against the contaminating action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (e.g., glycerol,  
20 propylene glycol and liquid polyethylene glycol), suitable mixtures thereof, and vegetable oils.
